Creating Healthy Work Environments 2019

The Effectiveness of Multi-Modal Analgesia

Mary A. Torres, MSN, RN, PHN, CCRN
Perioperative Services, Kaiser Permanente Medical Center-Zion Campus, San Diego, CA, USA

Abstract

Despite many advances in health care, managing pain in the post-anesthetic period continues to be a challenge. With more procedures being performed on an outpatient basis, shorter lengths of stay and drive to improve patient satisfaction, providers are looking for ways to enhance the surgical care experience and reduce opioid use. In addition, the increase burden of obesity in society has contributed to a rise in co-morbidities such as diabetes, cardiovascular, and gallbladder disease making laparoscopic cholecystectomies the second most frequently performed general surgery procedure in the United States. The purpose of this study was to examine if using multi-modal analgesia prior to incision time effectively reduces post-operative narcotic requirements for pain management in the laparoscopic cholecystectomy patient population. Current search of literature suggests that utilizing multi-modal therapy has shown to significantly reduce pain scores and continual research into this topic is necessary. Pain is a universal phenomenon and nurses must be familiar with the essential concepts of pain and methods of pain management. The concept of multi-modal analgesia is to reduce pain through targeting multiple receptor sites at peripheral and central nociception pathways to reduce the inflammatory response and pain sensation while simultaneously reducing narcotic utilization and their related adverse effects. Utilizing a quantitative, non-experimental research design this particular project retrospectively analyzed 200 elective laparoscopic cholecystectomy patient records from 2015 to 2018 in a specific recovery room unit. After categorizing the variables and performing a systematic evaluation of the collected information, the results demonstrated there was a rise in the number of multi-modal agents given with a decrease in the number of narcotics utilized over the course of implementing an enhanced recovery after surgery improvement program. The outcome of this project reinforces using multi-modal analgesia and provides a foundation for further research to maximize the benefit of these modalities to manage pain after surgical intervention.

Keywords: post-operative pain, laparoscopic surgery, pain management, nursing considerations

Title:
The Effectiveness of Multi-Modal Analgesia

Keywords:
Multi-modal, Post-operative pain and Reduced narcotic usage

References:

Abstract Summary:
As part of an enhanced recovery after surgery program, this capstone project highlights the use of multimodal analgesia in reducing narcotic use for managing post-operative pain.

Content Outline:
Introduction

1. Clinical problem
2. Research question

2. Background
1. Laparoscopic cholecystectomy
2. Pain management
3. Multi-modal analgesia

• Methodology

1. Quantitative
2. Non-experimental
3. Retrospective
4. Implementation
5. Setting
6. Sample
7. Data collection
8. Outcome
1. Analysis
2. Interpretation of findings
3. Implications for nursing practice

Professional Experience: Professional Experience Related to Submission 2015-present--Quality Improvement Coordinator for Perioperative Services, Kaiser Permanente Medical Center, San Diego, CA 2015-18--MSN student, Southern New Hampshire University, Manchester, NH 2012-15--Staff RN ICU/PACU, Kaiser Permanente Medical Center, San Diego, CA Responsible for coordinating and educating staff on quality improvement initiatives from regional perioperative services team, gathering data metrics and performing chart audits for documentation compliance. Participant in unit-based quality and safety teams. 2010-present--CCRN 1989-present-- RN, BSN, PHN

Author Summary: Ms. Torres is currently the quality improvement coordinator for perioperative services at Kaiser Permanente Medical Center-Zion Campus in San Diego, CA. Her background includes working as a staff and relief charge nurse for MICU/SICU and PACU care units. She has recently obtained her MSN from Southern New Hampshire University where her capstone focus was examining the effect of their enhanced recovery after surgery program implementation of multi-modal therapy in reducing opioid requirements for post-operative patients.
