A Catalyst for Change: Nurse Practitioners Chronic Care Model for Indigent Type II Diabetics

Beverley Brown, Ed.D, FNP-BC, ARNP,
Carrie Riley Risher, DNP, MSN, MA.ed, CMSRN, RN-BC
Personal Disclosure

We have nothing to disclose
Objectives

At the end of this session participants will be able to:

- Verbalize at least two components of a cost effective model for caring for indigent patients with type II diabetes mellitus
- Understand the Nurse Practitioner’s (NP) framework for reducing a diabetic patient’s HbA1c
- Identify three strategies used to encourage adherence to the care model standard of care
Background

- Parkview Clinic
- Chronic Care Model
- Indigent patient care
- Medication cost-treatment
- Lowering glycated hemoglobin A1C (HbA1c)
- Reduction of Complications
- NP lead clinic
- Care delivered by NP students
Nurse Practitioner led Type-II Diabetes Mellitus Chronic Care Model

The model of care includes: The Standard of Care – AHA/ADA

☐ Diet modification

☐ Exercise by walking for 30 minutes at least five times per week

☐ Foot examinations on every visit and daily at home

☐ Patient and family education using the teach-back method

☐ Medication management
Purpose

- Determine the impact of a chronic care model on a population of indigent Hispanic patients
- Lowering hemoglobin A1C (HbA1c) levels to less than 7%
- Decrease cardiovascular and renal disease incidence and mortality rates
Methods

- Retrospective chart reviews
- Type II Diabetes (N = 138)
- Inclusion criteria: indigent patients
- Type II Diabetes
Results

- Hispanic patients
- 67 males and 71 females; (n = 138).
- Initial HbA1c levels did not meet the recommended goal of less than 7% (n = 126; 91.3%).
- 41 patients (29.7%) met the recommended level by end of year two.
- A statistically significant improvement in the HbA1c levels over the course of the two year period (p ≤ 0.001).
Conclusion:

- Results from this study support a care model utilizing free and low cost diabetes medication.
- Diet and exercise therapy reduced HbA1c levels among an indigent patients population.
- These results can be used to contribute to the body of knowledge regarding ongoing care of indigent patients with Type II Diabetes.
- Results can be considered a catalyst for change when advocating for resources to support chronic care using a model of care for indigent patient populations that include free and low cost medication therapy in a clinic led by a NP working in collaboration with NP students.
