

Learning Activity:

LEARNING OBJECTIVES	EXPANDED CONTENT OUTLINE
The learner will be able to define the significant risks associated with CVCs in chronic, medically complex pediatric patients.	Data shows that CVC complications are costly financially and increase morbidity and mortality in this medically complex population. National and facility data will be presented in tables and graphs.
The learner will be able to list the contributions of each discipline and families to the advanced curriculum and discuss the value of an inter-disciplinary approach.	These medically complex patients require the involvement of many disciplines to marshal the resources necessary to care for these children. Families require ongoing education and support as the child's developmental needs change. Each discipline will provide insights and expert advice. Successful families provide innovative tips and support.
