Title:
Nurse Policy Entrepreneurship: A Multiple Streams Approach to Influence Traffic Safety in a Rural Community

Session Title:
Leadership Posters Session 2

Keywords:
Multiple Streams Approach, Nurse Policy Entrepreneur and Policy Window

References:

Abstract Summary:
The study explored the role of a Nurse Policy Entrepreneur to influence policy related to motor vehicle crashes (MVC) in a rural community. Applying the Multiple Streams Approach, the action research gathered MVC data; reviewed policies/best practices; and led stakeholders to create a policy change.

Learning Activity:

<table>
<thead>
<tr>
<th>LEARNING OBJECTIVES</th>
<th>EXPANDED CONTENT OUTLINE</th>
</tr>
</thead>
<tbody>
<tr>
<td>The learner will be able to describe how the role of a Nurse Policy Entrepreneur can influence health policy.</td>
<td>Through the review of the poster information, the learner will be able to gain new empirical knowledge related to the role of the Nurse Policy Entrepreneur. In addition, through review of the case study and direct discussion with the presenter, the participant will be able to understand how the Nurse policy Entrepreneur facilitated policy change in this rural community through collaboration with community members.</td>
</tr>
<tr>
<td>The learner will be able to articulate the steps of the Multiple Streams Approach required to facilitate the opening of a policy window.</td>
<td>The learner will be able to explain the steps of the Multiple Stream Approach to open a Policy Window through the merging of the Problem, Policy, and Political Streams. Both the framework and the actual steps of the study will be clearly explained. The learner will also be encouraged to apply this knowledge to their own practice through conclusions and recommendations at the end of the poster presentation.</td>

Abstract Text:
**Objective:** The purpose of this project was to implement and examine the role of a Nurse Policy Entrepreneur to reduce Motor Vehicle Crashes (MVC) in a rural community.

**Background:** Unintentional injuries are the leading cause of death in people under 44 years of age, and is the fifth foremost cause of death overall in the United States. Although motor vehicle traffic-related death rates have decreased over the past decade, MVC continues to be the leading cause of unintentional injury death among children under the age of 19. Literature states stronger policies are needed to reduce MVC.

Although policy making and agenda setting may be a novel role, nurses are well positioned to become policy entrepreneurs to assist in creating a policy window of opportunity to discuss this problem. A policy entrepreneur is able to help define the issue, understand the political climate, build teams and to provide leadership to address the issues such as motor vehicle crashes. Traffic fatalities are not unavoidable tragedies and need to be addressed as a preventable occurrence.

**Local Problem:** Even though motor vehicle mortality rates were higher than state and national benchmarks, motor vehicle crashes (MVC) were only considered a minor to moderate issue in the most recent Community Health Assessment Report in the focus county. MVC were currently only addressed in this rural community through limited, isolated initiatives. Deliberate actions were needed to raise awareness and help set the policy agenda related to MVC in the focus county.

**Design:** Applying the Multiple Streams Approach, the action research study concentrated on the role of a Nurse Policy Entrepreneur to gather data exploring specific local contributing factors and issues related to motor vehicle crashes; review current policies and best practices; meet with decision makers to open a policy window leading to a local policy change to reduce injury and fatalities from MVC.

**Measurements:** The Nurse Policy Entrepreneur analyzed a public MVC data to identify local priority issues. Teen injury crash prevention was selected as the priority issue. Policy analysis included comparison with peer counties and current literature to identify best practice. Top preforming peer counties all utilized a common policy/program for juvenile traffic offenders.

**Results:** Briefings with stakeholders created an open policy window through sharing a framed message to support the new policy/program. At the conclusion of the stakeholder alliance, in addition to verbal support, a modified Organizational Change Recipient's Belief Scale tool was used for assessment. Results revealed that teen injury MVC’s in the county was an important issue (discrepancy), the proposed program was the appropriate solution (appropriateness), along with principle support for the project. However, neutral results were found for both efficacy (personal influence to impact the issue) and personal gain/impact from the change. With community support for ongoing program oversight, the Nurse Policy Entrepreneur gained judicial approval for the policy change for teen driver offenders, signifying success by the Nurse Policy Entrepreneur to effect policy.

**Conclusions:** The application of the Multiple Streams Approach is a valuable tool for all nurses regardless of setting and needs to continue to be explored along with the further development of the role of a Nurse Policy Entrepreneur. The Multiple Streams Framework can successfully guide nurses to change policy in healthcare at any level of policy change and in any setting. Through intentionally and thoroughly assessing the problem, policy and political streams, a Nurse Policy Entrepreneur is able to merge the three currents with a framed message which can open a policy window for change to improve health.
