- Team work
- Education to patients
- Corpist Identity

Experiences and Care Expressions
- Meet Needs
- Assit
- Support

Conclusions
In this research, care is oriented towards the specific actions of meeting the needs of people with pathologies. In Family Care, this becomes the basis with which the nursing professionals explain their humanization of care. Critical thinking enables the administration of care, which gives them tools to fit better within a work team. It is essential to start working from the motivation for professional performance and improve communication channels to generate healthier work environments. Care with a family approach becomes the stronghold on which is established the theorization of what is found during the experiences of nursing professionals, which in practice generates processes of nursing care humanization.
